

```
sum [] = 0
```

```
sum (x:xs) = x + sum xs
```

```
isEven x = x `div` 2 == 0
```

```
sumEvens l =
```

```
  let evens = filter isEven
```

```
  in sum evens
```

 is applied at  (step )

The expression **evens** can have two conflicting types

sum

1 2 3 4

evens

5 6 7

Conflicting types

Possible type 1

evens :: **[Int]**

Inferred from the orange highlights on the left side

Possible type 2

evens :: **[Int] → [Int]**

Inferred from the blue highlights on the left side

Relevant type information

sum :: **[Int] → Int**

Inferred from the orange highlights on the left side

filter :: **(a → Bool) → [a] → [a]**
